

GREG TOLER · GT STRATEGIES

Go-to-Market and Operations Support

Strategy, systems, and hands-on execution for teams that
need it fixed, built, or scaled.

WORK WITH ME

CONNECT ON LINKEDIN ↗

WHAT I DO

Go-to-market and operations, strategy through execution

I help companies fix, build, and scale how they sell and how they run. The plan and the build, hands on, handed off so it runs without me.

Every engagement sits somewhere on this map.

ALL THE EXAMPLES AT [GREGTOLLER.COM/EXAMPLES](https://gregtoller.com/examples) →

HOW PEOPLE WORK WITH ME

Bottom-up or top-down

STRATEGY

EXECUTION

START ON THE EXECUTION HALF

Bottom-up

You know what needs to be fixed, built, or scaled.

Something specific. You have the details and need someone to execute.

STRATEGY

EXECUTION

START ON THE STRATEGY HALF

Top-down

You know something needs to change, not what is broken.

Strategic review first. Execution once a plan is in place.

BOTTOM-UP

Most people start with a project

SOMETHING IS BROKEN

Fix it

Make what exists work better.

Leads stalling, a ten-step process that should be three, hours going to work that should be automated. I find where it breaks and rebuild it. Implemented, not recommended.

IT DOES NOT EXIST YET

Build it

Make something new that needs to exist.

Off the shelf does not solve it, or custom is faster and cheaper. Applications, automations, AI systems, integrations, dashboards, internal tools.

IT WORKS, BY HAND

Scale it

Make what works scale.

It works, but it depends on one person doing it by hand. I document it, systematize the delivery, and train the team to run it.

Execution first. A specific thing, a specific problem. It often grows into how we scale it and look at the whole.

TOP-DOWN

Review the department

One function at a time, I review the people, the process, and the technology, in that order. Each review is measured against what the business needs most right now: more revenue, lower cost, or less risk.

They compound. The right people, doing a documented process, with technology applied to all of it. Once the plan and the rollout are in place, the work moves down into execution.

TOP-DOWN · PROCESS

Document it, then improve it

WHAT YOU GET

PROCESS DOCUMENTATION

SOPS AND CHECKLISTS

ROLES AND OWNERS

AN IMPROVEMENT BACKLOG

Process scales without adding people. Once it is written down and improved, technology has something to run. That is the next review.

TOP-DOWN · TECHNOLOGY

How I evaluate technology and AI

Only once the process is documented and improved. Then, for each piece of it, four questions in order.

WHAT EACH ONE HAS TO IMPROVE

BOTTOM-UP AND TOP-DOWN, IN AI TERMS

A one-off workflow, or a strategy

ONE-OFF WORKFLOW

Solves a specific problem

One workflow, one job. It stays on its own, and that is fine when the problem is contained.

STRATEGY

All the components working together

One view of the business, and each build makes the next one cheaper.

- Shared components
- Shared context
- Shared data, one source of truth

WORK WITH ME

Fix it, build it, or scale it.

Pick the thing that is costing you the most right now. Tell me what is going on and I will read it today and reply within one business day.

How I think about the map

Strategy / Execution

Strategy is the top half. Deciding what to change and why. Which accounts, which processes, which systems, in what order. Execution is the bottom half. Doing the work. Building the tool, writing the automation, fixing the process, and handing it off so it runs without me. Most consultants do one or the other. I do both, so the plan and the build come from the same person.

GTM / Operations

Go-to-market is the left half. Anything that finds a buyer and moves them forward. Targeting, campaigns, content, paid media, sales follow-up. Operations is the right half. Anything that runs underneath. The CRM and its data, reporting, the systems that connect teams, automation and AI. Most problems sit on the line between the two. A pipeline problem is usually a process or tooling problem underneath, so I work both sides.

THE FOUR QUADRANTS

What each one looks like

GTM, STRATEGY

GTM strategy

Deciding who to sell to and how to reach them, with the data to back it. The target list, the positioning, and the channel plan, so the team is not guessing.

- Account scoring, tiering, and target lists
- Positioning and competitive pages from closed-won evidence
- Paid media plans the team can actually run

GTM, EXECUTION

GTM execution

The campaigns, pages, content, and follow-up that reach a buyer, built so they work end to end and get measured.

- Landing pages, chatbots, and lead routing that work end to end
- Content reps can find and send
- Event follow-up that happens the same day

OPS, STRATEGY

RevOps & BizOps

Making the CRM, the marketing tools, and the product data agree, so the reporting is right and the team trusts the numbers it runs on.

- CRM, marketing automation, and product data joined up
- Dashboards across tools that do not report together
- Account health, lifecycle, and pipeline reporting

OPS, EXECUTION

Systems & automation

The plumbing underneath. Integrations, automation, agents, and internal tools, built to run without me and documented so the team owns them.

- Requests moving between teams without retyping
- Agents that research, draft, and wait for approval
- Integrations, MCP servers, and custom internal tools

Twelve examples, problem then build

Each one is written up in full at gregtoler.com/examples.

GTM, STRATEGY

Account scoring and tiering

Problem. Target lists were built by gut feel or by whichever vendor tag happened to be populated, and paid audiences inherited the same noise.

Build. A composite fit score across every account in the registry, rolled into four tiers with the features weighted in the open, so a rep can argue with a tier instead of a black box.

OPS, STRATEGY

Custom dashboards across systems that do not report together

Problem. The CRM, the marketing automation tool, the sequencing tool, the phone system, and the work management tool each reported on themselves and none agreed on who had been contacted or which form fill became a meeting.

Build. Read only pulls from every source joined on the person and the account, then the dashboard the team actually needs built on that model, and finally the schema promoted to a hosted database so the full funnel reports without a script.

GTM, STRATEGY

Competitive landing pages from closed-won data

Problem. Paid search was bidding on competitor names and landing on the homepage. Comparison pages did not exist and the team disagreed about tone.

Build. Researched why deals were won against each competitor in the CRM, built three pages from that, and wired a CMS template so new variants are a prompt away, with the funnel tracked end to end.

OPS, STRATEGY

Metabase product data into HubSpot

Problem. Product usage lived in the BI tool. The CRM got a hand built CSV once a week, so outreach, lifecycle emails, and account health all ran on stale data.

Build. Saved BI cards queried on a schedule and written to CRM properties on the contact and the company, matched on a user id so reruns update instead of duplicate, feeding trial scoring, lifecycle emails, and a paid health score.

GTM, STRATEGY

Paid media inside Claude

Problem. Multiple paid platforms, a team that was not technical enough to run them, and an agency being paid mostly to click buttons. Nobody could say what was live or pacing without waiting on a report.

Build. Three production MCP servers connect Google, LinkedIn, and Microsoft Ads to Claude, and a skill agent carries the ad playbooks and company context, so the team asks for a strategy or a budget shift and the same agent builds and deploys it.

OPS, STRATEGY

Account health from Slack

Problem. Checking an account's health meant a BI login and knowing the right saved question. Most people never looked.

Build. A Slack command takes an email or an org name, runs the same BI queries, and posts back a chart with a plain language summary and the score with the reasons behind it.

Twelve examples, problem then build

Each one is written up in full at gregtoller.com/examples.

GTM, EXECUTION

Assessment chatbot into Marketo, Salesforce, and Lemlist

Problem. A target list of 140 accounts needed a reason to engage beyond a whitepaper, and reps needed owned, warm leads without hand routing.

Build. A chatbot on the landing page adapts its questions as the visitor answers, turns the submission into a personalized audit, updates the marketing automation person, and in parallel routes the lead to an owner and enrolls it in that owner's sequence with copy drawn from the same answers.

OPS, EXECUTION

Event requests into Jira and Asana

Problem. About ten event requests a week arrived by email in no fixed format. Every one had to be retyped into the ticketing system and chased for whatever was missing.

Build. A script watches a folder. Drop the email in and it reads the thread, creates the record and the tasks with eleven fields filled, asks the requester for anything missing, and updates only what changed when the answer comes back.

GTM, EXECUTION

Content bot in Slack

Problem. Marketing had produced hundreds of articles, guides, and videos. Sales could not find them, so they asked in Slack and waited, or sent nothing.

Build. A content repository indexed and wired to a retrieval layer and a model behind a Slack app. A rep asks a plain question and the bot answers from approved content and lists the exact pieces to share.

OPS, EXECUTION

Marketing requests into RevOps

Problem. Marketing worked in Asana and RevOps worked in Jira. Requests were retyped by hand, half arrived without enough detail, and nobody could see progress once a ticket was in flight.

Build. Assigning a task hands it to an agent that pulls the full project context into a properly written ticket, sends a needs context subtask back when the detail is not there, and syncs status both ways after that.

GTM, EXECUTION

Voice notes to CRM and drafted follow ups

Problem. Event follow up died in the gap between the conversation and the laptop. Notes were lost, contacts never created, emails sent days late.

Build. A voice note from the phone is transcribed, matched to the event, written to the contact record, and turned into a personalized follow up waiting in the rep's drafts. Nothing sends without the rep.

OPS, EXECUTION

Research agents for a newsletter and tool directory

Problem. Two founders were doing a weekly newsletter and a tool directory's research and writing by hand, which left little time for sales, customers, and events.

Build. A set of agents behind an orchestrator does the research and the writing at scale, with a quality gate, a hallucination check, and a newsletter draft waiting for approval. The founders review rather than write.
